Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

In other circumstances, particularly when there is an urgent market requirement for such documents, a technical committee may decide to publish other types of normative document:

- an ISO Publicly Available Specification (ISO/PAS) represents an agreement between technical experts in an ISO working group and is accepted for publication if it is approved by more than 50 % of the members of the parent committee casting a vote;
- an ISO Technical Specification (ISO/TS) represents an agreement between the members of a technical committee and is accepted for publication if it is approved by 2/3 of the members of the committee casting a vote.

An ISO/PAS or ISO/TS is reviewed after three years in order to decide whether it will be confirmed for a further three years, revised to become an International Standard, or withdrawn. If the ISO/PAS or ISO/TS is confirmed, it is reviewed again after a further three years, at which time it must either be transformed into an International Standard or be withdrawn.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO/TS 12747 was prepared by Technical Committee ISO/TC 67, *Materials, equipment and offshore structures for petroleum, petrochemical and natural gas industries*, Subcommittee SC 2, *Pipeline transportation systems*.

Introduction

Within ISO/TC 67/SC 2 there has been a series of discussions concerning both the needs and level of prescription required to address pipeline life extension issues. [These have highlighted that:](#)

- [operators are applying differing approaches](#), which [leads](#) to inefficient use of both operator and [authority](#) resources;
- the assessment and upgrading of existing facilities [has been](#) based on deterministic methods found in design standards, probabilistic / reliability - based methods or a combination of these;
- the level of detail delivered varies.

The purpose of this Technical Specification is to address the above concerns by providing a consistent approach to pipeline [life](#) extension assessment that can be applied by operators (or parties acting on their behalf) across the industry.

[This Technical Specification is concerned with the proof of technical integrity of the pipeline system for the justification of extended operation. Integrity management is not covered in detail. However, the interface between a PIMS and the life extension process is considered because:](#)

- [a PIMS, where present, forms an integral part of the integrity assessment of the pipeline system;](#)
- [a PIMS of some form will be required for operation in extended life.](#)

[Factors affecting the future operability of the system but not the technical integrity, such as the loss of a control umbilical, will be flagged as requiring assessment but will not be addressed in full in this document.](#)

[Whilst this document is aimed primarily at the pipeline operators, it will also be of interest to other stakeholders such as:](#)

- [regulators approving the life extension application;](#)
- [members of the public affected by the life extension application, such as landowners and developers.](#)

[In light of this, an overview of the life extension process and the key principles involved is given in Clause 5. The remainder of the document is intended to provide detailed guidance to those performing the life extension assessments.](#)

[All guidance is provided for use in conjunction with sound engineering practice and judgement. This document is not intended for use as a design code.](#)

Pipeline transportation systems — Recommended practice for pipeline life extension

Richard Espiner 25/8/10 10:07

Formatted: Portuguese (Brazil)

1 Scope

This Technical Specification gives guidance that should be followed, as a minimum, in order to assess the feasibility of extending the service life of a pipeline system, as defined in ISO 13623, beyond its specified design life. Pump stations, compressor stations, pressure-reduction stations and depots, are not specifically addressed by this Technical Specification. This is illustrated in Figure 1.

Richard Espiner 25/8/10 10:31

Deleted: extent of pipeline systems covered

Richard Espiner 25/8/10 10:28

Deleted: It applies to onshore and offshore pipeline systems connecting wells, production plants, process plants, refineries and storage facilities. It also applies to any section of a pipeline constructed within the boundaries of such facilities for connection purposes.

This Technical Specification applies to rigid metallic pipelines. It is not applicable to the following:

- flexible pipelines;
- pipelines constructed from other materials such as glass reinforced plastics;
- umbilicals;
- topsides equipment;
- structures and structural components.

5 Life extension overview

Richard Espiner 25/8/10 11:28
Deleted: Lifetime

5.1 General

The design life of a pipeline is derived to prevent failure during operation due to time-dependent degradation mechanisms such as corrosion and fatigue. However, the expiry of the design life does not automatically mean that the pipeline system is not fit-for-purpose:

- corrosion rates determined during the design process might have been conservative and/or corrosion defects might have been repaired;
- the anticipated operational fatigue damage might have been overestimated.

Richard Espiner 25/8/10 11:22
Deleted: may

Richard Espiner 25/8/10 11:22
Deleted: may

Extended operation beyond the pipeline design life might be desirable when recoverable oil and gas remains, or where additional operational assets are tied (or are to be tied) into the pipeline system.

Richard Espiner 25/8/10 11:22
Deleted: may

NOTE There are alternatives to pipeline life extension, such as installing a replacement pipeline. Therefore, a business case will be required to determine the most suitable option by comparing the cost of the mitigation necessary to achieve the desired life extension with the cost of a new pipeline.

Richard Espiner 25/8/10 11:23
Deleted: may

Richard Espiner 25/8/10 11:23
Deleted: . The business case should

5.2 Assessment process

If the intention is to operate a pipeline system beyond its specified design life, a life extension assessment shall be performed. The aim of this assessment is to demonstrate that by extending the life of the pipeline system, the operator is not exposing society to unacceptable risk.

Richard Espiner 25/8/10 11:23
Deleted: e

Figure 2 illustrates the pipeline system life extension assessment process. The shaded boxes highlight the distinct stages of the assessment and cross-references to the Clause of this Technical Specification dealing with a particular stage are provided.

Deleted: lifetime

Richard Espiner 25/8/10 11:35
Deleted: must

Richard Espiner 25/8/10 11:35
Deleted: Section

Once an acceptable life extension has been determined, the assessment process shall be fully documented (item 5). If life extension is not possible (or if a replacement pipeline would be the most economical solution), the pipeline should be decommissioned at the end of the design life as originally planned.

Richard Espiner 25/8/10 11:28
Deleted: lifetime

5.3 Assessment requirements

Richard Espiner 25/8/10 11:36
Deleted: and an application submitted to the regulatory bodies for approval

The [life extension process](#) illustrated in Figure 2 involves an assessment of the current pipeline system integrity and an assessment to determine the suitability of the pipeline system for life extension.

Richard Espiner 25/8/10 11:28
Deleted: lifetime

The assessment of the current integrity (item 2) shall include, but not be limited to, the following:

- review of the pipeline system operational history;
- detailed assessment of the current technical integrity of the pipeline system.

The [life extension assessment](#) (item 4) shall include, but not be limited to, the following:

Richard Espiner 25/8/10 11:28
Deleted: lifetime

- a) risk assessment for extended operation;
- b) review of the pipeline system design, including a gap analysis to identify the additional requirements of the current design codes;
- c) assessment of the remnant life of the system, including the following:

Richard Espiner 25/8/10 12:11
Deleted: such as API RP 1111, DNV-OS-F101, ISO 13623 and PD 8010

- corrosion assessment [accounting for both accumulated and future corrosion in combination with a defect assessment](#);
- fatigue assessment, accounting for both accumulated and future fatigue damage;
- coating breakdown and CP system degradation [assessment](#);
- identification and assessment of any other time dependent degradation mechanism active in the pipeline.

Richard Espiner 25/8/10 12:03
Deleted: (in accordance with ASME B31G or similar)

Richard Espiner 25/8/10 12:10
Deleted: (in accordance with DNV-RP-C203 or similar)

Richard Espiner 25/8/10 12:17
Deleted: assessment of

- d) revision or introduction of the PIMS for the extended operating period, including update of the anomaly limits;

Richard Espiner 25/8/10 12:11
Deleted: (DNV-RP-F116 and other similar standards provide guidance on PIMS)

- e) the identification of any tenure issue (e.g. [expiry of permit to occupy land](#)) or statutory requirements (e.g. pipeline licence renewal), including a gap analysis to identify any additional regulatory requirements introduced during the pipeline design life;

Richard Espiner 25/8/10 12:13
Deleted: expiry

- f) review of the adequacy of the safety and operating systems;
- g) review of the adequacy of the operating and maintenance, emergency response and safety and environmental procedures.

Additional studies shall be performed as required, in order to determine the need for remedial measures to mitigate the threats to the pipeline system anticipated during the extended operational period.

5.4 Limitations on life extension

The allowable life extension is governed by the assessed remnant life of the pipeline system, as illustrated in Figure 3.

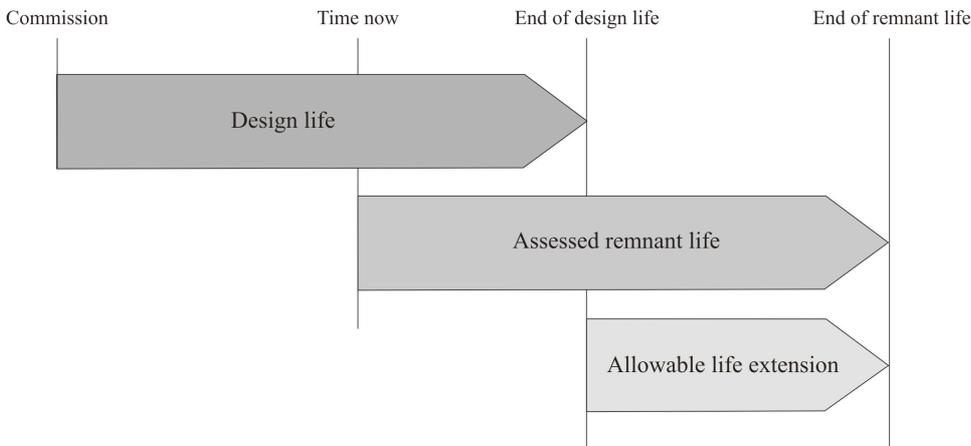

Figure 3 — Life extension and remnant life

If the required life of the pipeline system exceeds the remnant life, the remnant life assessment may be repeated considering the implementation of remedial measures such as:

- replacement of pipeline components;
- reassessment of anomaly limits and rectification of any anomalies;
- de-rating of the pipeline system.

Alternatively, it is possible for the life extension to be performed in stages. This is illustrated by the following examples.

EXAMPLE 1 A life extension of 20 years is required for a pipeline system, following the tie-in of a new asset, but the remnant life of the pipeline system is only 5 years due to excessive riser corrosion. In this case, an initial 5 year life extension could be made, followed by a further extension of 15 years upon replacement of the riser at the end of its remnant life.

EXAMPLE 2 A life extension of 20 years is required for a pipeline system, but due to the predicted corrosion rates, a reduction in MAOP will be required in 2 years. In a similar fashion to Example 1 above, an initial 2 year life extension could be made, with a further extension of 18 years subject to favourable results from an ILL run. If the ILL run confirmed the predicted corrosion rate, reduction in MAOP or rectification of the unacceptable defects would still be required after 2 years in order to achieve the required 20 year life extension.

5.5 Pipeline system availability

The guidance given in this Technical Specification is concerned with the proof of technical integrity of the pipeline system. However, the availability of the pipeline system during the life extension is also of critical importance. As such, a separate assessment of the integrity of the following should be carried out as part of the life extension process, as applicable:

6 Data compilation

6.1 General

Typical data required for a [life](#) extension assessment of a pipeline system is listed in [6.2](#). This does not constitute an exhaustive list, therefore additional data should be gathered as required. The use of accurate data is vital and the level of confidence in the data source shall be considered [as part of](#) the assessment.

[When performing the life extension assessment, the degree of missing data shall be assessed and remedial actions, such as additional pipeline inspections or risk assessments, shall be identified where appropriate.](#)

[NOTE 1 When considering aging pipelines there is often data missing, especially if the operatorship has passed through several organisations.](#)

[NOTE 2 In specific instances, such as for CP surveys, the use of the most recent inspection results is appropriate.](#)

6.2 Data

6.2.1 Original design

[Original design data](#) should include:

- [a\) Original codes and standards, including edition number and date;](#)
- [b\) Design, fabrication and installation details;](#)
- [c\) Design basis;](#)
- [d\) Material specification and certification;](#)
- [e\) Analysis calculations and reports;](#)
- [f\) Hydrotest certificates;](#)
- [g\) Environmental Impact Assessments;](#)
- [h\) Risk assessments, including ECAs;](#)
- [i\) Pressure safety systems;](#)
- [j\) Inspection and test certification and reports;](#)

7 Technical integrity of the pipeline system

7.1 General

The integrity of the pipeline system [might](#) have deteriorated since installation. The level of [information available to characterise the deterioration](#) experienced depends upon the monitoring and management systems implemented by the operator.

NOTE Integrity management practice varies with different operators in different parts of the world. In some cases, an ongoing risk assessment process is adopted, whilst in other cases assessments are performed less frequently. Consequently the level of assessment required to justify [life](#) extension will vary.

9 Life extension assessment

9.1 Risk assessment

9.1.1 Process

Risk assessment is the process of identifying threats to the integrity of the pipeline system, estimating the probability and consequence of failure before determining the acceptability of the risk. This is highlighted in Figure 4.

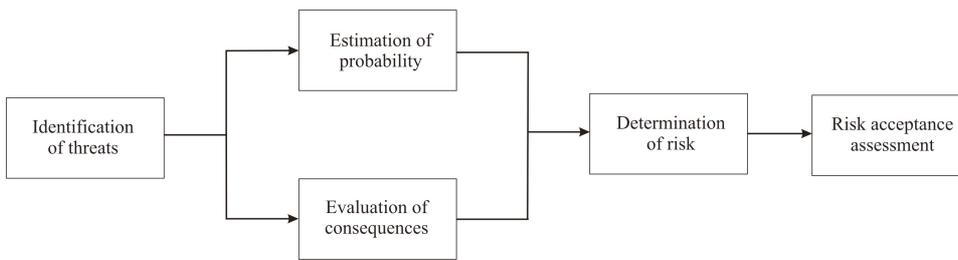

Figure 4 — Risk assessment process

Risk assessment can be qualitative or quantitative. Qualitative risk assessment is subjective, whilst quantitative risk assessment provides a direct numerical measure of risk.

NOTE ISO 31000 provides further guidance on the risk assessment process.

9.1.2 Use of risk assessment in life extension

The pipeline life extension assessment shall be based on a thorough understanding of the threats that the pipeline is subject to and the consequent risk to technical integrity. A risk assessment, considering the threats to the pipeline system during the extended operating period, shall therefore form a major part of the life extension assessment.

Richard Espiner 25/8/10 14:56
Deleted: ould therefore

Richard Espiner 25/8/10 14:57
Deleted: The fundamental outcome of such assessments should be a clear understanding of when the risk of pipeline failure becomes unacceptable.

Richard Espiner 25/8/10 10:07
Formatted: Font:8 pt, Check spelling and grammar

Richard Espiner 25/8/10 10:07
Formatted: Check spelling and grammar

The following approach shall be adopted:

- a) perform an initial qualitative risk assessment to identify the major threats to the system;
- b) perform a QRA of the major threats identified by the qualitative assessment.

Richard Espiner 25/8/10 14:58
Deleted: A risk assessment, considering the threats to the pipeline system during the extended operating period, shall therefore form a major part of the lifetime extension assessment.

Richard Espiner 25/8/10 14:53
Deleted: may

The outcome of the risk assessment shall be an estimate of how long the pipeline system can be operated before the risk of failure exceeds an acceptable level.

Richard Espiner 25/8/10 14:03
Formatted: Outline numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0 cm + Tab after: 0.63 cm + Indent at: 0.71 cm, Tabs:Not at 0.63

9.1.3 Acceptability of risk

The acceptability of the risks identified by the risk assessment shall be assessed and remedial measures prescribed where necessary to reduce risks to acceptable levels. The assessment of risk acceptability for a pipeline life extension, however, is not a trivial process:

Richard Espiner 25/8/10 15:04
Deleted: ISO 31000 provides further guidance on the risk assessment process. .

- operators, regulators and the general public have different views on acceptability of risk;
- the acceptability of risk changes with time and what was acceptable 20 years ago may not be now;
- the acceptability of risk changes with geographical location.

Richard Espiner 25/8/10 10:52
Formatted: Bullets and Numbering

Richard Espiner 25/8/10 15:20
Deleted: may

NOTE Further guidance on the acceptability of risk and target failure probabilities is given in ISO 16708.

9.2 Pipeline system design review

9.2.1 Design codes

9.2.1.1 Original design method

Design codes generally adopt either an allowable stress or limit-state approach to pipeline design. The design code used for the original pipeline design will have a significant effect on the [life](#) extension process.

Richard Espiner 25/8/10 11:28
Deleted: lifetime

Pipelines designed to an allowable stress design code, such as PD 8010, are generally easier to assess than those designed using a limit-state design approach, such as that adopted in DNV-OS-F101. Allowable stress design codes are usually more conservative, resulting in a greater wall thickness to resist corrosion during operation. In addition, a pipeline designed using an allowable stress design code may still be considered as fit-for-purpose if the appropriate factors of safety are satisfied.

9.2.1.2 Updates to design codes

It is likely that the design codes to which the pipeline system was originally designed will have been updated during the operational period. This [can](#) result in non-conformance of the original design due to the following:

Richard Espiner 25/8/10 15:23
Deleted: may

- a change in the design methodology or safety factors;
- the prohibition of the use of components allowed in previous versions of the design codes, such as mitred bends.

A gap analysis [shall](#) be performed to identify any changes in design code requirements since installation and determine the compliance of the pipeline design with the current design codes. Where non-conformances are identified, risk assessment [shall](#) be used to determine the need for remedial actions.

Richard Espiner 25/8/10 15:24

9.2.2 Changes to the design [basis](#)

The [life](#) extension assessment shall account for any changes to the original design [basis](#). The consequences of any changes that have occurred during the design life or are anticipated as a result of [life](#) extension shall be addressed. Typical changes are discussed [in 9.2.2.1, 9.2.2.2 and 9.2.2.3](#).

Richard Espiner 25/8/10 15:24
Deleted: premiseRichard Espiner 25/8/10 11:28
Deleted: lifetime

9.2.2.1 Process conditions

Changes in process conditions [can](#) have a significant influence on pipeline corrosion rates and applied loads. These typically include:

Richard Espiner 25/8/10 15:24
Deleted: premiseRichard Espiner 25/8/10 15:25
Deleted: belowRichard Espiner 25/8/10 11:28
Deleted: lifetime

- changes in operating pressure, temperature and flow rate;
- changes in corrosion regime (e.g. sweet to sour);
- increased water cut;
- process shut downs;
- increased sand content;
- increased wax deposition.

Richard Espiner 25/8/10 15:29

Deleted: , due to factors such as process upset, tie-ins or changes in predicted well conditions, may

9.2.2.2 Design loads

An assessment shall be performed to identify any changes to the original pipeline design loads. Such changes include:

Richard Espiner 25/8/10 15:29
Deleted: mayRichard Espiner 25/8/10 10:07
Formatted: Font:8 pt, Check spelling and grammar

Richard Espiner 25/8/10 10:07
Formatted: Check spelling and grammar

- an increase in environmental loading acting upon the pipeline system, including [wave and current loading](#), [wind loading and soil motion and deformation](#);
- an increase in interference loading (e.g. increase in fishing interaction loads on subsea pipelines due to the use of larger fishing gear);
- fatigue loading due to changes in process conditions (e.g. slugging);
- additional loading due to modifications and repairs.

Richard Espiner 25/8/10 15:30
Formatted: List Continue

The effect of any changes to the design loads on the acceptability of the pipeline design (in accordance with current codes and standards) shall be assessed. Remedial measures shall be identified as required.

9.2.2.3 Safety class

Increases in population density, changes in land use and changes in the pipeline corridor requirements over the design life [can](#) result in the enforcement of a more stringent location class (and hence safety class) in regions of the pipeline system. This [can](#) result in the non-conformance of the pipeline design with the requirements of the design codes.

9.3.3 Remediation

If the remnant life of the pipeline system is found to be insufficient, the following remedial measures should be considered:

Richard Espiner 25/8/10 15:57
Deleted: may

a) General:

- 1) reduction in the desired life extension;
- 2) modification of the flow regime;
- 3) cut out and replacement of unacceptable sections or components.

b) Corrosion:

- 1) introduction or modification of the corrosion inhibitor scheme;
- 2) anode replacement or addition;
- 3) reduction in the pipeline system MAOP, allowing greater metal loss;
- 4) increase in the inspection frequencies to allow more accurate corrosion rates to be determined.

c) Fatigue:

- 1) installation of supports or clamps;
- 2) rockdumping or trenching of exposed sections of pipeline and spans;
- 3) installation of VIV suppression devices.

9.4 Integrity management during extended life

9.4.1 PIMS

The integrity of the pipeline system should be managed during the extended operating period to ensure continued fitness-for-purpose. The PIMS and associated documents shall be modified as part of the life extension process to reflect any changes to the integrity requirements for the extended operating period.

Richard Espiner 25/8/10 15:59

A PIMS typically covers the following:

- roles and responsibilities;
- operations and safety systems;
- technical integrity assessment;
- corrosion monitoring;
- fatigue and stress;
- modifications management;
- flow assurance;
- instrumentation and control;
- risk management.

NOTE Further guidance on the contents of a PIMS can be found in integrity management documents such as DNV-RP-F116.

Richard Espiner 25/8/10 16:00
Formatted: Note

9.4.2 Inspection and monitoring

Inspection routines shall be reviewed as part of the life extension process and amended as appropriate. This is particularly important for risk-based inspection strategies, where the underlying risk assessment shall be reviewed in light of the findings of the life extension. This can result in more frequent inspections to mitigate an increased risk of failure in a deteriorating pipeline.

Monitoring and sampling activities shall also be reviewed to ensure that all of the data required to perform the regular integrity management assessments is collected.

9.5 Regulatory requirements

The regulatory requirements for extended operation of a pipeline system differ worldwide and the requirements for the specific pipeline system, such as the renewal of permits and licenses and the update of the safety case, shall be identified.

A gap analysis shall be performed to identify modifications and additions to the regulatory requirements since the pipeline was installed. The associated risks of any such changes shall be assessed and mitigated.

9.6 Update of systems and procedures

9.6.1 General

To ensure the safe operation of the pipeline system during the extended life, whilst minimising the effects of a failure on the public and the environment, the control procedures and contingency plans shall be reviewed.

Table 1 — Contents of the life extension report

Section	Description
Executive summary	Overview of <u>life</u> extension process.
Introduction	Description of pipeline location, history and the purpose of the <u>life</u> extension requirement.
Conclusions	The findings of the <u>life</u> extension assessment, including: <ul style="list-style-type: none"> - remnant life and associated life extension period; - required legislative approvals; - deviations from original design basis and non-conformances; - deviations from current legislation and codes; - corrosion, fatigue and wall thickness assessment results; - any residual risks; - risk mitigation measures.
Recommendations	Recommendations for remedial measures or further inspection and assessment, necessary to justify life extension.
Licence, permit agreements and organisations	Licence holder, owner and operator structures and agreements. Past, present and future regulatory agreements should also be addressed.
Design and construction	Summary of pipeline system design and construction, including: <ul style="list-style-type: none"> - original design requirements, codes and specifications; - review of original design against current design codes; - description of any difficulties or unforeseen events prior to start-up; - construction methods (particularly new or non-standard methods).
Operation	Review of operational history and a summary of future operations.
Current integrity of the pipeline system	Review of the current integrity of the pipeline system, including: <ul style="list-style-type: none"> - condition of the pipelines, risers and tie-in spools; - condition and functionality of safety critical items such as ESDVs; - internal corrosion assessment, accounting for any chemical injection; - condition of coatings and CP systems; - assessment of the effects of any repairs or modifications; - fatigue assessment; - assessment of the effects of any changes in land use or settlement; - review of identified anomalies.
<u>life</u> extension assessment	Description and findings of the <u>life</u> extension assessment covered by Clause 9 of this document.
Studies	Identification of any specific work or studies (past and future) that may have an impact on the pipeline and its life extension.
References	References to all documentation used during the compilation of the report.
Appendices	Useful information such as: <ul style="list-style-type: none"> - inspection and monitoring records used to assess pipeline integrity; - calculations performed during the <u>life</u> extension assessment.
